

ANTIFUNGAL AIR PROTECTION - PREVENTING THE SPREAD OF PATHOGENS

Recently, due to global warming, fungal diseases are increasingly developing. Pulmonary mycoses attract special attention from physicians all over the world. These are serious diseases that affect the whole body and whose end can often be fatal. Treatment for these diseases has already been found, but it is complex, time-consuming and not always effective.

In this case, the golden words of the great Hippocrates come to mind: a disease is easier to prevent than to treat. And indeed it is! In the vast majority of cases, infection is transmitted through the air. And how can infection be prevented in this case? Of course, by disinfecting the air in enclosed spaces. Desair devices create a "healthy space" in as little as 30 minutes with an efficiency proven by prestigious laboratories to be 99.99%. Thanks to patented technology, these devices not only "catch" but kill viruses, bacteria and fungi. And your home, school, gym... become safe spaces for health. And this opportunity to minimize the likelihood of disease is in your hands at a very affordable price.
