

PROTECTION AGAINST VIRUSES AND BACTERIA: THE SOLUTION TO TODAY'S REALITY

Although humans believe they are the crown of creation, they actually live in a world where microorganisms reign, the most important of which for human life are viruses and bacteria. Most of which constitute a hostile environment for humans, causing various diseases, the most common of which are influenza and colds.

Today, 219 known viruses can infect a person at any time, and 3 or 4 new names appear on this list every year. Our body, of course, adapts and learns to fight each of these pathogens. However, when there is an opportunity to help us, it is simply necessary to take advantage of it.

Desair's air disinfection devices can be of great help in this matter. Their effectiveness has already been confirmed by prestigious laboratories in Europe, Asia, and South America. In just 30 minutes of operation of this device, any enclosed space is clean of dangerous pathogens, even when it is full of people. The patented technology is safe for people and animals. And the proven effectiveness is 99.99%. At the same time, the price is more than affordable.

We have all heard the words of the great Hippocrates that preventing a disease is easier than treating it, but, unfortunately, we often forget this. But it is very easy to help ourselves and others.
